Office: S1.27 (1st floor Strand Building)

Slides: KEATS

# The Goal of this Course

## A Compiler

# The Goal of this Course

lexer input: a string

“read(n);”

lexer output: a sequence of tokens

key(read); lpar; id(n); rpar; semi

→ compilation

# The Goal of this Course

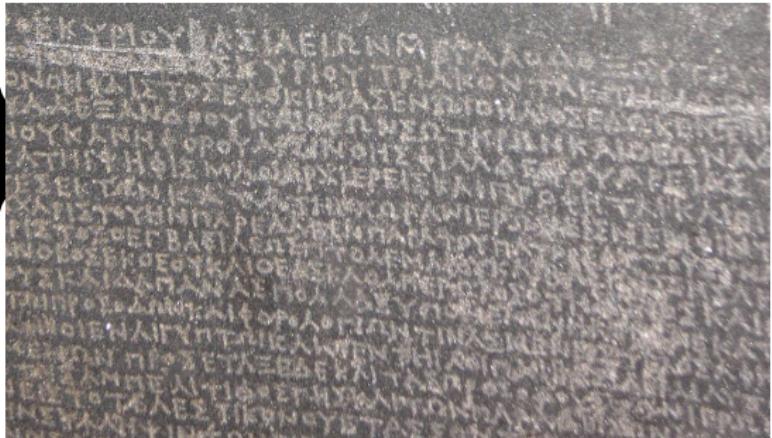

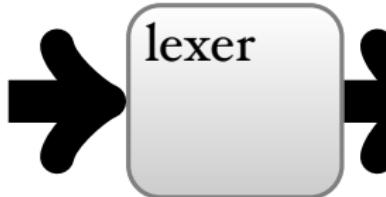

lexer input: a string

”read(n);”

lexer output: a sequence of tokens

key(read); lpar; id(n); rpar; semi

→ decomposition

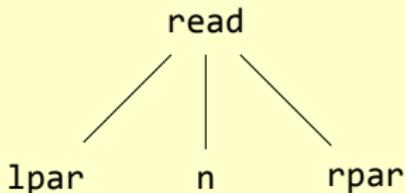

lexing ⇒ recognising words (Stone of Rosetta)

# The Goal of this Course

parser input: a sequence of tokens

parser output: an abstract syntax tree

# The Goal of this Course

code generator:

```
istore 2  
iload 2  
ldc 10  
isub  
ifeq Label2  
iload 2  
...
```

## Compiler

# The Goal of this Course

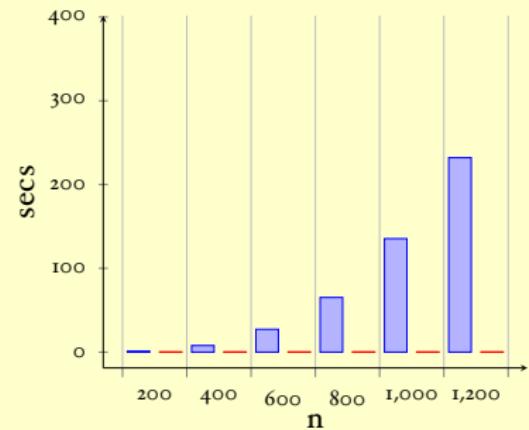

code generator:

```
istore 2  
iload 2  
ldc 10  
isub  
ifeq Label2  
iload 2
```

...

Compiler

parse

# The subject is quite old

- Turing Machines, 1936
- Regular Expressions, 1956
- The first compiler for COBOL, 1957  
(Grace Hopper)
- But surprisingly research papers are still published nowadays

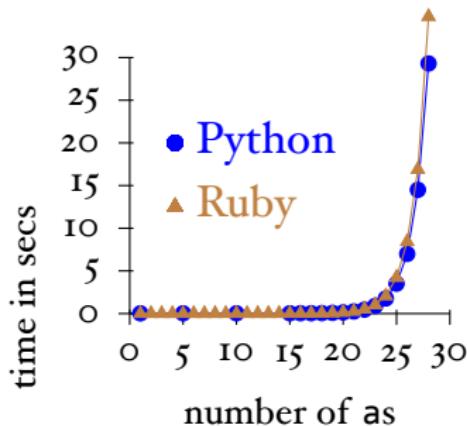

Grace Hopper

(she made it to David Letterman's Tonight Show,

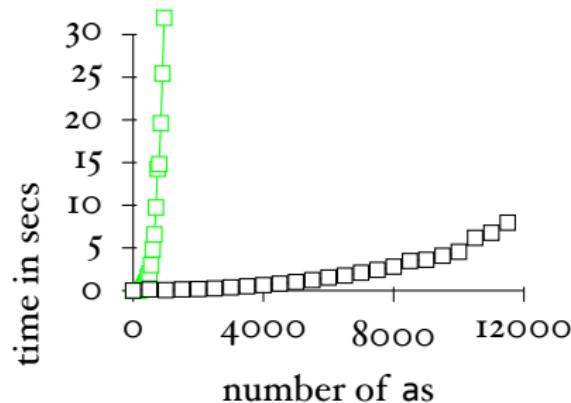

<http://www.youtube.com/watch?v=aZ0xtURhfEU>)

# Why Bother?

Ruby, Python  
and Others

Us (after this course)

matching  $[a?]\{n\}[a]\{n\}$  against  $\underbrace{a...a}_n$

# Lectures 1 - 6

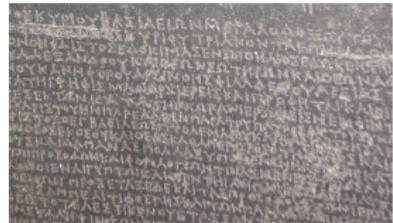

transforming strings into structured data

## Lexing

(recognising “words”)

## Parsing

(recognising “sentences”)

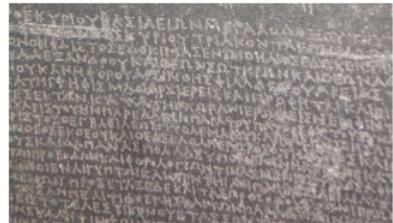

Stone of Rosetta

# Lectures 1 - 6

transforming strings into structured data

**Lexing**      based on regular expressions  
(recognising “words”)

**Parsing**  
(recognising “sentences”)

Stone of Rosetta

# Familiar Regular Expr.

[a-zA-Z0-9\_.-]+ @ [a-zA-Z0-9\_.-]+ . [a-zA-Z.]{2,6}

re*	matches 0 or more times
re+	matches 1 or more times
re?	matches 0 or 1 times
re{n}	matches exactly n number of times
re{n,m}	matches at least n and at most m times
[...]	matches any single character inside the brackets
[^...]	matches any single character not inside the brackets
a-zA-Z	character ranges
\d	matches digits; equivalent to [0-9]
.	matches every character except newline
(re)	groups regular expressions and remembers the matched text

# Today

- the ultimate goal is to implement a small compiler (a really small one for the JVM)

Let's start with:

- a web-crawler
- an email harvester
- a web-scraper

# A Web-Crawler

- ① given an URL, read the corresponding webpage
- ② extract all links from it
- ③ call the web-crawler again for all these links

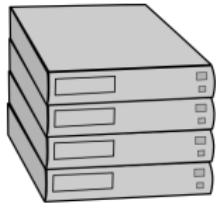

# A Web-Crawler

- ① given an URL, read the corresponding webpage
- ② if not possible print, out a problem
- ③ if possible, extract all links from it
- ④ call the web-crawler again for all these links

# A Web-Crawler

- ① given an URL, read the corresponding webpage
- ② if not possible print, out a problem
- ③ if possible, extract all links from it
- ④ call the web-crawler again for all these links

(we need a bound for the number of recursive calls)  
(the purpose is to check all links on my own webpage)

Server

GET request

Browser

# Scala

A simple Scala function for reading webpages:

```
import io.Source

def get_page(url: String) : String = {
    Source.fromURL(url).take(10000).mkString
}
```

# Scala

A simple Scala function for reading webpages:

```
import io.Source

def get_page(url: String) : String = {
    Source.fromURL(url).take(10000).mkString
}

get_page("http://www.inf.kcl.ac.uk/staff/urbanc/")
```

# Scala

A simple Scala function for reading webpages:

```
import io.Source

def get_page(url: String) : String = {
    Source.fromURL(url).take(10000).mkString
}
```

```
get_page("http://www.inf.kcl.ac.uk/staff/urbanc")
```

A slightly more complicated version for handling errors properly:

```
def get_page(url: String) : String = {
    Try(Source.fromURL(url).take(10000).mkString) getOrElse
        { println(s" Problem with: $url"); "" }
}
```

# A Regular Expression

- ... is a pattern or template for specifying strings

”https?://[^”]\*”

matches for example

”http://www.foobar.com”

”https://www.tls.org”

# A Regular Expression

- ... is a pattern or template for specifying strings

”””https?://[^”]\*”””.r

matches for example

”http://www.foobar.com”

”https://www.tls.org”

# Finding Operations

**`rexp.findAllIn(string)`**

returns a list of all (sub)strings that match the regular expression

**`rexp.findFirstIn(string)`**

returns either

- None if no (sub)string matches or
- Some(s) with the first (sub)string

```
val http_pattern = """https?://[^"]*""".r

def unquote(s: String) = s.drop(1).dropRight(1)

def get_all_URLs(page: String) : Set[String] =
  http_pattern.findAllIn(page).map(unquote).toSet

def crawl(url: String, n: Int) : Unit = {
  if (n == 0) ()
  else {
    println(s"Visiting: $n $url")
    for (u <- get_all_URLs(get_page(url))) crawl(u, n - 1)
  }
}

crawl(some_start_URL, 2)
```

A version that only crawls links in “my” domain:

```
val my_urls = """urbanc""".r

def crawl(url: String, n: Int) : Unit = {
  if (n == 0) ()
  else if (my_urls.findFirstIn(url) == None) {
    println(s"Visiting: $n $url")
    get_page(url); ()
  }
  else {
    println(s"Visiting: $n $url")
    for (u <- get_all_URLs(get_page(url))) crawl(u, n - 1)
  }
}
```

## A little email harvester:

```
val http_pattern = """https?://[^]*""".r
val my_urls = """urbanc""".r
val email_pattern =
  """([a-z0-9_\.-]+)@([\da-z\.-]+)\.([a-zA-Z]{2,6})""".r

def print_str(s: String) =
  if (s == "") () else println(s)

def crawl(url: String, n: Int) : Unit = {
  if (n == 0) ()
  else {
    println(s"Visiting: $n $url")
    val page = get_page(url)
    print_str(email_pattern.findAllIn(page).mkString("\n"))
    for (u <- get_all_URLs(page).par) crawl(u, n - 1)
  }
}
```

<http://net.tutsplus.com/tutorials/other/8-regular-expressions-you-should-know/>

# Regular Expressions

Their inductive definition:

$r ::=$	$\emptyset$	null
	$\epsilon$	empty string / " " / [ ]
	$c$	character
	$r_1 \cdot r_2$	sequence
	$r_1 + r_2$	alternative / choice
	$r^*$	star (zero or more)

# Regular Expressions

In Scala:

```
def OPT(r: Rexp) = ALT(r, EMPTY)

def NTIMES(r: Rexp, n: Int) : Rexp = n match {
  case 0 => EMPTY
  case 1 => r
  case n => SEQ(r, NTIMES(r, n - 1))
}
```

# Strings

...are lists of characters. For example "hello"

[h, e, l, l, o]

the empty string: [] or ""

the concatenation of two strings:

$s_1 @ s_2$

$foo @ bar = foobar, baz @ [] = baz$

# The Meaning of a Regular Expression

$$L(\emptyset) \stackrel{\text{def}}{=} \emptyset$$

$$L(\epsilon) \stackrel{\text{def}}{=} \{[]\}$$

$$L(c) \stackrel{\text{def}}{=} \{[c]\}$$

$$L(r_1 + r_2) \stackrel{\text{def}}{=} L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) \stackrel{\text{def}}{=} \{s_1 @ s_2 \mid s_1 \in L(r_1) \wedge s_2 \in L(r_2)\}$$

$$L(r^*) \stackrel{\text{def}}{=}$$

# The Meaning of a Regular Expression

$$L(\emptyset) \stackrel{\text{def}}{=} \emptyset$$

$$L(\epsilon) \stackrel{\text{def}}{=} \{[]\}$$

$$L(c) \stackrel{\text{def}}{=} \{[c]\}$$

$$L(r_1 + r_2) \stackrel{\text{def}}{=} L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) \stackrel{\text{def}}{=} \{s_1 @ s_2 \mid s_1 \in L(r_1) \wedge s_2 \in L(r_2)\}$$

$$L(r^*) \stackrel{\text{def}}{=}$$

$$L(r)^\circ \stackrel{\text{def}}{=} \{[]\}$$

$$L(r)^{n+1} \stackrel{\text{def}}{=} L(r) @ L(r)^n$$

# The Meaning of a Regular Expression

$$L(\emptyset) \stackrel{\text{def}}{=} \emptyset$$

$$L(\epsilon) \stackrel{\text{def}}{=} \{[]\}$$

$$L(c) \stackrel{\text{def}}{=} \{[c]\}$$

$$L(r_1 + r_2) \stackrel{\text{def}}{=} L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) \stackrel{\text{def}}{=} \{s_1 @ s_2 \mid s_1 \in L(r_1) \wedge s_2 \in L(r_2)\}$$

$$L(r^*) \stackrel{\text{def}}{=}$$

$$L(r)^\circ \stackrel{\text{def}}{=} \{[]\}$$

$$L(r)^{n+1} \stackrel{\text{def}}{=} L(r) @ L(r)^n \quad (\text{append on sets})$$
$$\{s_1 @ s_2 \mid s_1 \in L(r) \wedge s_2 \in L(r)^n\}$$

# The Meaning of a Regular Expression

$$L(\emptyset) \stackrel{\text{def}}{=} \emptyset$$

$$L(\epsilon) \stackrel{\text{def}}{=} \{[]\}$$

$$L(c) \stackrel{\text{def}}{=} \{[c]\}$$

$$L(r_1 + r_2) \stackrel{\text{def}}{=} L(r_1) \cup L(r_2)$$

$$L(r_1 \cdot r_2) \stackrel{\text{def}}{=} \{s_1 @ s_2 \mid s_1 \in L(r_1) \wedge s_2 \in L(r_2)\}$$

$$L(r^*) \stackrel{\text{def}}{=} \bigcup_{n \geq 0} L(r)^n$$

$$L(r)^\circ \stackrel{\text{def}}{=} \{[]\}$$

$$L(r)^{n+1} \stackrel{\text{def}}{=} L(r) @ L(r)^n \quad (\text{append on sets})$$
$$\{s_1 @ s_2 \mid s_1 \in L(r) \wedge s_2 \in L(r)^n\}$$

# The Meaning of Matching

A regular expression  $r$  matches a string  $s$  provided

$$s \in L(r)$$

# Written Exam

- Accounts for 75%.
- You will understand the question “Is this relevant for the exam?” is very demotivating for the lecturer!
- Deal: Whatever is in the homework (and is not marked “optional”) is relevant for the exam.

# Coursework

- Accounts for 25%. Two strands. Choose **one!**

## Strand 1

- four programming subtasks:
  - matcher (5%, 13.10.)
  - lexer (5%, 03.11.)
  - parser (5%, 27.11.)
  - compiler (10%, 12.12.)

## Strand 2

- one task: prove the correctness of a regular expression matcher in the Isabelle theorem prover
- 25%, submission 12.12.

- Solving more than one strand will **not** give you more marks.
- The exam will contain in much, much smaller form elements from both (but will also be in lectures and HW).

# Questions?
