Office: N7.07 (North Wing, Bush House)

Slides: KEATS (also home work is there)

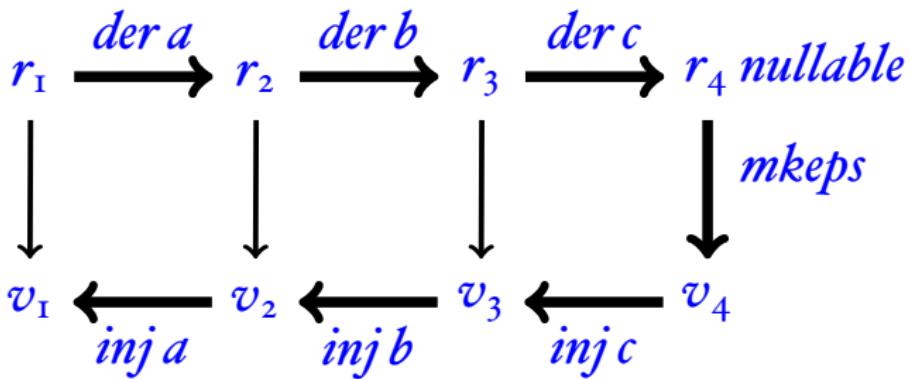

# Last Week

# Regexes and Values

Regular expressions and their corresponding values:

$r ::= \bullet$	$v ::=$
$\epsilon$	<i>Empty</i>
$c$	<i>Char</i> ( $c$ )
$r_1 \cdot r_2$	<i>Seq</i> ( $v_1, v_2$ )
$r_1 + r_2$	<i>Left</i> ( $v$ )
$r^*$	<i>Right</i> ( $v$ )
	$[v_1, \dots, v_n]$

- $r_1: a \cdot (b \cdot c)$   
 $r_2: \mathbf{I} \cdot (b \cdot c)$   
 $r_3: (\mathbf{0} \cdot (b \cdot c)) + (\mathbf{I} \cdot c)$   
 $r_4: (\mathbf{0} \cdot (b \cdot c)) + ((\mathbf{0} \cdot c) + \mathbf{I})$

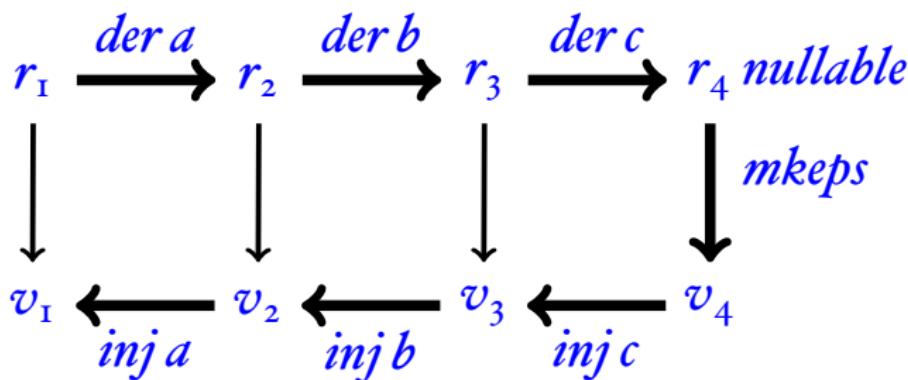

- $v_1: Seq(Char(a), Seq(Char(b), Char(c)))$   
 $v_2: Seq(Empty, Seq(Char(b), Char(c)))$   
 $v_3: Right(Seq(Empty, Char(c)))$   
 $v_4: Right(Right(Empty))$

$ v_1 :$	$abc$
$ v_2 :$	$bc$
$ v_3 :$	$c$
$ v_4 :$	$[]$

# Simplification

- If we simplify after the derivative, then we are building the value for the simplified regular expression, but *not* for the original regular expression.

$$(b \cdot c) + (\mathbf{0} + \mathbf{1}) \mapsto (b \cdot c) + \mathbf{1}$$

# Records

- new regex:  $(x : r)$     new value:  $Rec(x, v)$
- $nullable(x : r) \stackrel{\text{def}}{=} nullable(r)$
- $der\ c(x : r) \stackrel{\text{def}}{=} der\ c\ r$
- $mkeps(x : r) \stackrel{\text{def}}{=} Rec(x, mkeps(r))$
- $inj\ (x : r)\ c\ v \stackrel{\text{def}}{=} Rec(x, inj\ r\ c\ v)$

for extracting subpatterns  $(z : ((x : ab) + (y : ba)))$

# Environments

Obtaining the “recorded” parts of a value:

$$\text{env}(\text{Empty}) \stackrel{\text{def}}{=} []$$

$$\text{env}(\text{Char}(c)) \stackrel{\text{def}}{=} []$$

$$\text{env}(\text{Left}(v)) \stackrel{\text{def}}{=} \text{env}(v)$$

$$\text{env}(\text{Right}(v)) \stackrel{\text{def}}{=} \text{env}(v)$$

$$\text{env}(\text{Seq}(v_1, v_2)) \stackrel{\text{def}}{=} \text{env}(v_1) @ \text{env}(v_2)$$

$$\text{env}([v_1, \dots, v_n]) \stackrel{\text{def}}{=} \text{env}(v_1) @ \dots @ \text{env}(v_n)$$

$$\text{env}(\text{Rec}(x : v)) \stackrel{\text{def}}{=} (x : |v|) :: \text{env}(v)$$

# While Tokens

```
WHILE_REGS  $\stackrel{\text{def}}{=}$  ((”k” : KEYWORD) +
    (”i” : ID) +
    (”o” : OP) +
    (”n” : NUM) +
    (”s” : SEMI) +
    (”p” : (LPAREN + RPAREN)) +
    (”b” : (BEGIN + END)) +
    (”w” : WHITESPACE))*
```

”if true then then 42 else +”

KEYWORD(if),

# Coursework: Nullable

$\text{nullable}([c_1 c_2 \dots c_n])$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^+)$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^?)$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^{\{n\}})$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^{\{n..\}})$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^{\{..n\}})$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(r^{\{n..m\}})$	$\stackrel{\text{def}}{=} ?$
$\text{nullable}(\sim r)$	$\stackrel{\text{def}}{=} ?$

$\text{der } c ([c_1 c_2 \dots c_n])$	$\stackrel{\text{def}}{=} ?$
$\text{der } c (r^+)$	$\stackrel{\text{def}}{=} ?$
$\text{der } c (r?)$	$\stackrel{\text{def}}{=} ?$
$\text{der } c (r^{\{n\}})$	$\stackrel{\text{def}}{=} \text{if } n = \circ \text{ then } \bullet \text{ else } (\text{der } c r) \cdot r^{\{n-1\}}$
$\text{der } c (r^{\{n..\}})$	$\stackrel{\text{def}}{=} \text{if } n = \circ \text{ then } (\text{der } c r) \cdot r^*$ $\qquad \qquad \qquad \text{else } (\text{der } c r) \cdot r^{\{n-1..\}}$
$\text{der } c (r^{\{..n\}})$	$\stackrel{\text{def}}{=} \text{if } n = \circ \text{ then } \bullet \text{ else } (\text{der } c r) \cdot r^{\{..n-1\}}$
$\text{der } c (r^{\{n..m\}})$	$\stackrel{\text{def}}{=} \text{if } n = \circ \wedge m = \circ \text{ then } \bullet \text{ else}$ $\qquad \qquad \qquad \text{if } n = \circ \wedge m > \circ \text{ then } (\text{der } c r) \cdot r^{\{..m-1\}}$ $\qquad \qquad \qquad \text{else } (\text{der } c r) \cdot r^{\{n-1..m-1\}}$
$\text{der } c (\sim r)$	$\stackrel{\text{def}}{=} ?$

# Coursework: CFUN

$$\text{nullable}(\text{CFUN}(\_)) \stackrel{\text{def}}{=} \text{false}$$

$$\text{der } c (\text{CFUN}(f)) \stackrel{\text{def}}{=} \text{if } (c) \text{ then } \mathbf{i} \text{ else } \mathbf{o}$$

$$\text{CHAR}(c) \stackrel{\text{def}}{=} \text{CFUN}(\lambda d. c = d)$$

$$\text{CSET}([c_1, \dots, c_n]) \stackrel{\text{def}}{=} \text{CFUN}(\lambda d. d \in [c_1, \dots, c_n])$$

$$\text{ALL} \stackrel{\text{def}}{=} \text{CFUN}(\lambda d. \text{true})$$

# Lexer, Parser

Today a parser.

# Regular Languages

While regular expressions are very useful for lexing, there is no regular expression that can recognise the language  $a^n b^n$ .

$((((())())())()$  vs.  $((((())())())()$ )

So we cannot find out with regular expressions whether parentheses are matched or unmatched. Also regular expressions are not recursive, e.g.  $(1 + 2) + 3$ .

# Hierarchy of Languages

all languages

decidable languages

context sensitive languages

context-free languages

regular languages

# CF Grammars

A **context-free grammar**  $G$  consists of

- a finite set of nonterminal symbols ( $\langle$ upper case $\rangle$ )
- a finite terminal symbols or tokens (lower case)
- a start symbol (which must be a nonterminal)
- a set of rules

$$\langle A \rangle ::= rhs$$

where  $rhs$  are sequences involving terminals and nonterminals, including the empty sequence  $\epsilon$ .

# CF Grammars

A **context-free grammar**  $G$  consists of

- a finite set of nonterminal symbols ( $\langle$ upper case $\rangle$ )
- a finite terminal symbols or tokens (lower case)
- a start symbol (which must be a nonterminal)
- a set of rules

$$\langle A \rangle ::= rhs$$

where  $rhs$  are sequences involving terminals and nonterminals, including the empty sequence  $\epsilon$ .

We also allow rules

$$\langle A \rangle ::= rhs_1 | rhs_2 | \dots$$

# Palindromes

A grammar for palindromes over the alphabet  $\{a, b\}$ :

$$\langle S \rangle ::= \epsilon$$

$$\langle S \rangle ::= a \cdot \langle S \rangle \cdot a$$

$$\langle S \rangle ::= b \cdot \langle S \rangle \cdot b$$

# Palindromes

A grammar for palindromes over the alphabet  $\{a, b\}$ :

$$\langle S \rangle ::= \epsilon$$

$$\langle S \rangle ::= a \cdot \langle S \rangle \cdot a$$

$$\langle S \rangle ::= b \cdot \langle S \rangle \cdot b$$

or

$$\langle S \rangle ::= \epsilon \mid a \cdot \langle S \rangle \cdot a \mid b \cdot \langle S \rangle \cdot b$$

# Palindromes

A grammar for palindromes over the alphabet  $\{a, b\}$ :

$$\langle S \rangle ::= \epsilon$$

$$\langle S \rangle ::= a \cdot \langle S \rangle \cdot a$$

$$\langle S \rangle ::= b \cdot \langle S \rangle \cdot b$$

or

$$\langle S \rangle ::= \epsilon \mid a \cdot \langle S \rangle \cdot a \mid b \cdot \langle S \rangle \cdot b$$

Can you find the grammar rules for matched parentheses?

# Arithmetic Expressions

$$\begin{aligned}\langle E \rangle ::= & \text{ } num\_token \\ | & \text{ } \langle E \rangle \cdot + \cdot \langle E \rangle \\ | & \text{ } \langle E \rangle \cdot - \cdot \langle E \rangle \\ | & \text{ } \langle E \rangle \cdot * \cdot \langle E \rangle \\ | & \text{ } (\cdot \langle E \rangle \cdot)\end{aligned}$$

# Arithmetic Expressions

$$\begin{aligned}\langle E \rangle ::= & \text{ } num\_token \\ | & \text{ } \langle E \rangle \cdot + \cdot \langle E \rangle \\ | & \text{ } \langle E \rangle \cdot - \cdot \langle E \rangle \\ | & \text{ } \langle E \rangle \cdot * \cdot \langle E \rangle \\ | & \text{ } (\cdot \langle E \rangle \cdot)\end{aligned}$$

1 + 2 \* 3 + 4

# A CFG Derivation

- ➊ Begin with a string containing only the start symbol, say  $\langle S \rangle$
- ➋ Replace any nonterminal  $\langle X \rangle$  in the string by the right-hand side of some production  $\langle X \rangle ::= rhs$
- ➌ Repeat 2 until there are no nonterminals

$$\langle S \rangle \rightarrow \dots \rightarrow \dots \rightarrow \dots \rightarrow \dots$$

# Example Derivation

$$\langle S \rangle ::= \epsilon \mid a \cdot \langle S \rangle \cdot a \mid b \cdot \langle S \rangle \cdot b$$

$$\begin{aligned}\langle S \rangle &\rightarrow a\langle S \rangle a \\&\rightarrow ab\langle S \rangle ba \\&\rightarrow aba\langle S \rangle aba \\&\rightarrow abaaba\end{aligned}$$

# Example Derivation

$$\begin{aligned}\langle E \rangle ::= & \text{num\_token} \\ | & \langle E \rangle \cdot + \cdot \langle E \rangle \\ | & \langle E \rangle \cdot - \cdot \langle E \rangle \\ | & \langle E \rangle \cdot * \cdot \langle E \rangle \\ | & (\cdot \langle E \rangle \cdot)\end{aligned}$$

$$\begin{aligned}\langle E \rangle &\rightarrow \langle E \rangle * \langle E \rangle \\ &\rightarrow \langle E \rangle + \langle E \rangle * \langle E \rangle \\ &\rightarrow \langle E \rangle + \langle E \rangle * \langle E \rangle + \langle E \rangle \\ &\rightarrow^+ 1 + 2 * 3 + 4\end{aligned}$$

# Example Derivation

$\langle E \rangle ::= \text{num\_token}$

|  $\langle E \rangle \cdot + \cdot \langle E \rangle$

|  $\langle E \rangle \cdot - \cdot \langle E \rangle$

|  $\langle E \rangle \cdot * \cdot \langle E \rangle$

|  $(\cdot \langle E \rangle \cdot)$

$\langle E \rangle \rightarrow \langle E \rangle * \langle E \rangle$   
 $\rightarrow \langle E \rangle + \langle E \rangle * \langle E \rangle$   
 $\rightarrow \langle E \rangle + \langle E \rangle * \langle E \rangle + \langle E \rangle$   
 $\rightarrow^+ 1 + 2 * 3 + 4$

$\langle E \rangle \rightarrow \langle E \rangle + \langle E \rangle$   
 $\rightarrow \langle E \rangle + \langle E \rangle + \langle E \rangle$   
 $\rightarrow \langle E \rangle + \langle E \rangle * \langle E \rangle + \langle E \rangle$   
 $\rightarrow^+ 1 + 2 * 3 + 4$

# Context Sensitive Grammars

It is much harder to find out whether a string is parsed by a context sensitive grammar:

$$\langle S \rangle ::= b \langle S \rangle \langle A \rangle \langle A \rangle \mid \epsilon$$

$$\langle A \rangle ::= a$$

$$b \langle A \rangle ::= \langle A \rangle b$$

# Context Sensitive Grammars

It is much harder to find out whether a string is parsed by a context sensitive grammar:

$$\langle S \rangle ::= b \langle S \rangle \langle A \rangle \langle A \rangle \mid \epsilon$$

$$\langle A \rangle ::= a$$

$$b \langle A \rangle ::= \langle A \rangle b$$

$$\langle S \rangle \rightarrow \dots \rightarrow ? ababaa$$

# Language of a CFG

Let  $G$  be a context-free grammar with start symbol  $\langle S \rangle$ . Then the language  $L(G)$  is:

$$\{c_1 \dots c_n \mid \forall i. c_i \in T \wedge \langle S \rangle \rightarrow^* c_1 \dots c_n\}$$

# Language of a CFG

Let  $G$  be a context-free grammar with start symbol  $\langle S \rangle$ . Then the language  $L(G)$  is:

$$\{c_1 \dots c_n \mid \forall i. c_i \in T \wedge \langle S \rangle \rightarrow^* c_1 \dots c_n\}$$

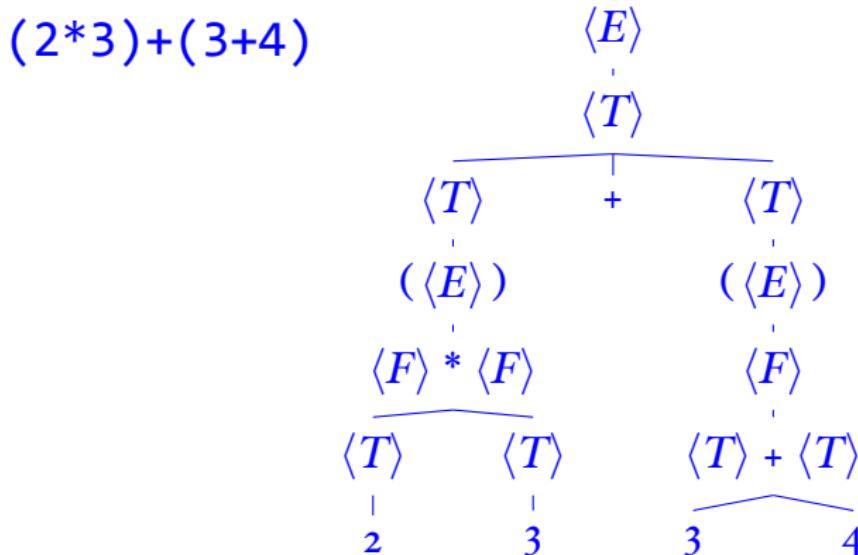

- Terminals, because there are no rules for replacing them.
- Once generated, terminals are “permanent”.
- Terminals ought to be tokens of the language (but can also be strings).

# Parse Trees

$\langle E \rangle ::= \langle F \rangle \mid \langle T \rangle \cdot + \cdot \langle E \rangle \mid \langle T \rangle \cdot - \cdot \langle E \rangle$

$\langle T \rangle ::= \langle F \rangle \mid \langle F \rangle \cdot * \cdot \langle T \rangle$

$\langle F \rangle ::= num\_token \mid (\cdot \langle E \rangle \cdot)$

# Arithmetic Expressions

$$\begin{aligned}\langle E \rangle ::= & \textit{num\_token} \\ | & \langle E \rangle \cdot + \cdot \langle E \rangle \\ | & \langle E \rangle \cdot - \cdot \langle E \rangle \\ | & \langle E \rangle \cdot * \cdot \langle E \rangle \\ | & (\cdot \langle E \rangle \cdot)\end{aligned}$$

# Arithmetic Expressions

$$\begin{aligned}\langle E \rangle ::= & \text{ } num\_token \\ & | \text{ } \langle E \rangle \cdot + \cdot \langle E \rangle \\ & | \text{ } \langle E \rangle \cdot - \cdot \langle E \rangle \\ & | \text{ } \langle E \rangle \cdot * \cdot \langle E \rangle \\ & | \text{ } (\cdot \langle E \rangle \cdot)\end{aligned}$$

A CFG is **left-recursive** if it has a nonterminal  $\langle E \rangle$  such that  $\langle E \rangle \rightarrow^+ \langle E \rangle \cdot \dots$

# Ambiguous Grammars

A grammar is **ambiguous** if there is a string that has at least two different parse trees.

$$\begin{aligned}\langle E \rangle ::= & \textit{num\_token} \\ | & \langle E \rangle \cdot + \cdot \langle E \rangle \\ | & \langle E \rangle \cdot - \cdot \langle E \rangle \\ | & \langle E \rangle \cdot * \cdot \langle E \rangle \\ | & (\cdot \langle E \rangle \cdot)\end{aligned}$$

1 + 2 \* 3 + 4

# Dangling Else

Another ambiguous grammar:

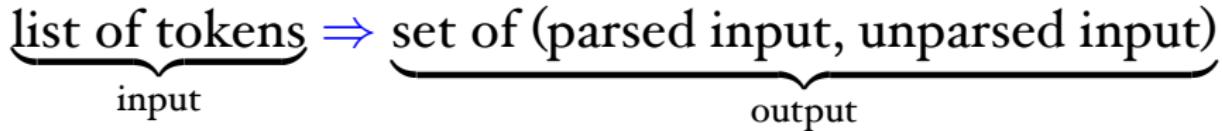

$$\begin{array}{lcl} E & \rightarrow & \text{if } E \text{ then } E \\ & | & \text{if } E \text{ then } E \text{ else } E \\ & | & \dots \end{array}$$

if a then if x then y else c

# Parser Combinators

One of the simplest ways to implement a parser,  
see <https://vimeo.com/142341803>

Parser combinators:

- atomic parsers
- sequencing
- alternative
- semantic action

Atomic parsers, for example, number tokens

$$\text{Num}(123) :: rest \Rightarrow \{(\text{Num}(123), rest)\}$$

- you consume one or more token from the input (stream)
- also works for characters and strings

## Alternative parser (code $p \parallel q$ )

- apply  $p$  and also  $q$ ; then combine the outputs

$$p(\text{input}) \cup q(\text{input})$$

## Sequence parser (code $p \sim q$ )

- apply first  $p$  producing a set of pairs
- then apply  $q$  to the unparsed part
- then combine the results:  
 $((\text{output}_1, \text{output}_2), \text{unparsed part})$   
$$\{ ((o_1, o_2), u_2) \mid (o_1, u_1) \in p(\text{input}) \wedge (o_2, u_2) \in q(u_1) \}$$

## Function parser (code $p \Rightarrow f$ )

- apply  $p$  producing a set of pairs
- then apply the function  $f$  to each first component

$$\{(f(o_I), u_I) \mid (o_I, u_I) \in p(\text{input})\}$$

## Function parser (code $p \Rightarrow f$ )

- apply  $p$  producing a set of pairs
- then apply the function  $f$  to each first component

$$\{(f(o_I), u_I) \mid (o_I, u_I) \in p(\text{input})\}$$

$f$  is the semantic action (“what to do with the parsed input”)

# Semantic Actions

Addition

$$T \sim + \sim E \Rightarrow \underbrace{f((x,y),z)}_{\text{semantic action}} \Rightarrow x + z$$

# Semantic Actions

Addition

$$T \sim + \sim E \Rightarrow f((x, y), z) \Rightarrow x + z$$

semantic action

Multiplication

$$F \sim * \sim T \Rightarrow f((x, y), z) \Rightarrow x * z$$

# Semantic Actions

Addition

$$T \sim + \sim E \Rightarrow f((x, y), z) \Rightarrow x + z$$

semantic action

Multiplication

$$F \sim * \sim T \Rightarrow f((x, y), z) \Rightarrow x * z$$

Parenthesis

$$( \sim E \sim ) \Rightarrow f((x, y), z) \Rightarrow y$$

# Types of Parsers

- **Sequencing:** if  $p$  returns results of type  $T$ , and  $q$  results of type  $S$ , then  $p \sim q$  returns results of type

$$T \times S$$

# Types of Parsers

- **Sequencing:** if  $p$  returns results of type  $T$ , and  $q$  results of type  $S$ , then  $p \sim q$  returns results of type

$$T \times S$$

- **Alternative:** if  $p$  returns results of type  $T$  then  $q$  must also have results of type  $T$ , and  $p \parallel q$  returns results of type

$$T$$

# Types of Parsers

- **Sequencing:** if  $p$  returns results of type  $T$ , and  $q$  results of type  $S$ , then  $p \sim q$  returns results of type

$$T \times S$$

- **Alternative:** if  $p$  returns results of type  $T$  then  $q$  must also have results of type  $T$ , and  $p \parallel q$  returns results of type

$$T$$

- **Semantic Action:** if  $p$  returns results of type  $T$  and  $f$  is a function from  $T$  to  $S$ , then  $p \Rightarrow f$  returns results of type

$$S$$

# Input Types of Parsers

- input: token list
- output: set of (output\_type, token list)

# Input Types of Parsers

- input: token list
- output: set of (output\_type, token list)

actually it can be any input type as long as it is a kind of sequence (for example a string)

# Scannerless Parsers

- input: **string**
- output: set of (output\_type, **string**)

but lexers are better when whitespaces or comments need to be filtered out; then input is a sequence of tokens

# Successful Parses

- input: string
- output: **set of**(output\_type, string)

a parse is successful whenever the input has been fully “consumed” (that is the second component is empty)

# Abstract Parser Class

```
abstract class Parser[I, T] {
    def parse(ts: I): Set[(T, I)]

    def parse_all(ts: I) : Set[T] =
        for ((head, tail) <- parse(ts);
              if (tail.isEmpty)) yield head
}
```

```

class AltParser[I, T](p: => Parser[I, T],
                      q: => Parser[I, T])
                      extends Parser[I, T] {
  def parse(sb: I) = p.parse(sb) ++ q.parse(sb)
}

class SeqParser[I, T, S](p: => Parser[I, T],
                         q: => Parser[I, S])
                         extends Parser[I, (T, S)] {
  def parse(sb: I) =
    for ((head1, tail1) <- p.parse(sb);
          (head2, tail2) <- q.parse(tail1))
        yield ((head1, head2), tail2)
}

class FunParser[I, T, S](p: => Parser[I, T], f: T => S)
                           extends Parser[I, S] {
  def parse(sb: I) =
    for ((head, tail) <- p.parse(sb))
      yield (f(head), tail)
}

```

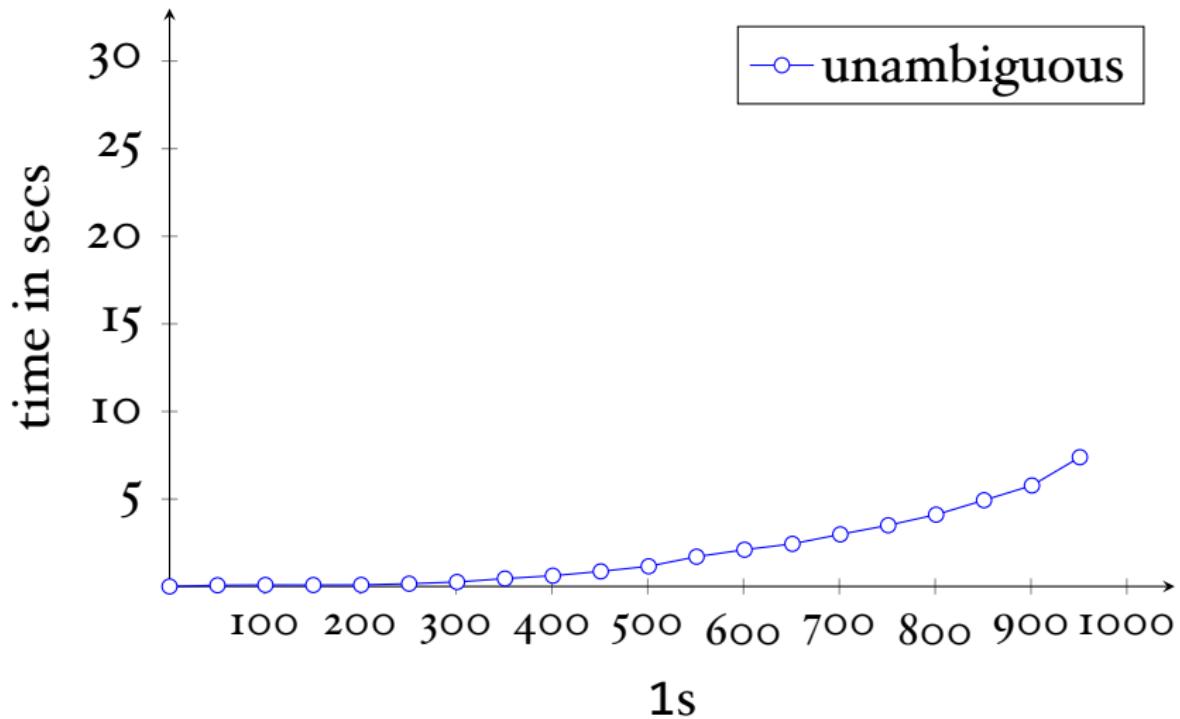

# Two Grammars

Which languages are recognised by the following two grammars?

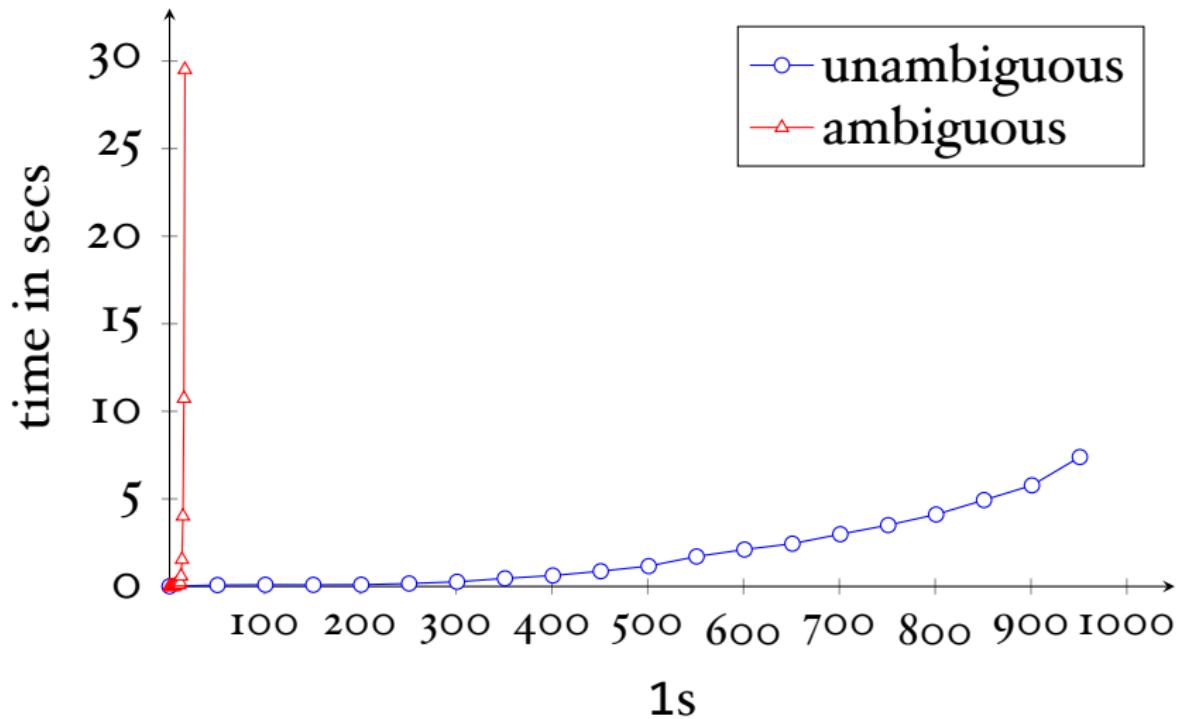

$$\begin{array}{lcl} S & \rightarrow & i \cdot S \cdot S \\ & | & \epsilon \end{array}$$

$$\begin{array}{lcl} U & \rightarrow & i \cdot U \\ & | & \epsilon \end{array}$$

# Ambiguous Grammars

# Ambiguous Grammars

# While-Language

$\langle Stmt \rangle ::= \text{skip}$

|  $\langle Id \rangle := \langle AExp \rangle$

| if  $\langle BExp \rangle$  then  $\langle Block \rangle$  else  $\langle Block \rangle$

| while  $\langle BExp \rangle$  do  $\langle Block \rangle$

$\langle Stmts \rangle ::= \langle Stmt \rangle ; \langle Stmts \rangle$

|  $\langle Stmt \rangle$

$\langle Block \rangle ::= \{ \langle Stmts \rangle \}$

|  $\langle Stmt \rangle$

$\langle AExp \rangle ::= \dots$

$\langle BExp \rangle ::= \dots$

# An Interpreter

```
{  
    x := 5;  
    y := x * 3;  
    y := x * 4;  
    x := u * 3  
}
```

- the interpreter has to record the value of  $x$  before assigning a value to  $y$

# An Interpreter

```
{  
    x := 5;  
    y := x * 3;  
    y := x * 4;  
    x := u * 3  
}
```

- the interpreter has to record the value of  $x$  before assigning a value to  $y$
- `eval(stmt, env)`

# Interpreter

$\text{eval}(n, E)$	$\stackrel{\text{def}}{=} n$
$\text{eval}(x, E)$	$\stackrel{\text{def}}{=} E(x) \quad \text{lookup } x \text{ in } E$
$\text{eval}(a_1 + a_2, E)$	$\stackrel{\text{def}}{=} \text{eval}(a_1, E) + \text{eval}(a_2, E)$
$\text{eval}(a_1 - a_2, E)$	$\stackrel{\text{def}}{=} \text{eval}(a_1, E) - \text{eval}(a_2, E)$
$\text{eval}(a_1 * a_2, E)$	$\stackrel{\text{def}}{=} \text{eval}(a_1, E) * \text{eval}(a_2, E)$
$\text{eval}(a_1 = a_2, E)$	$\stackrel{\text{def}}{=} \text{eval}(a_1, E) = \text{eval}(a_2, E)$
$\text{eval}(a_1 \neq a_2, E)$	$\stackrel{\text{def}}{=} \neg(\text{eval}(a_1, E) = \text{eval}(a_2, E))$
$\text{eval}(a_1 < a_2, E)$	$\stackrel{\text{def}}{=} \text{eval}(a_1, E) < \text{eval}(a_2, E)$

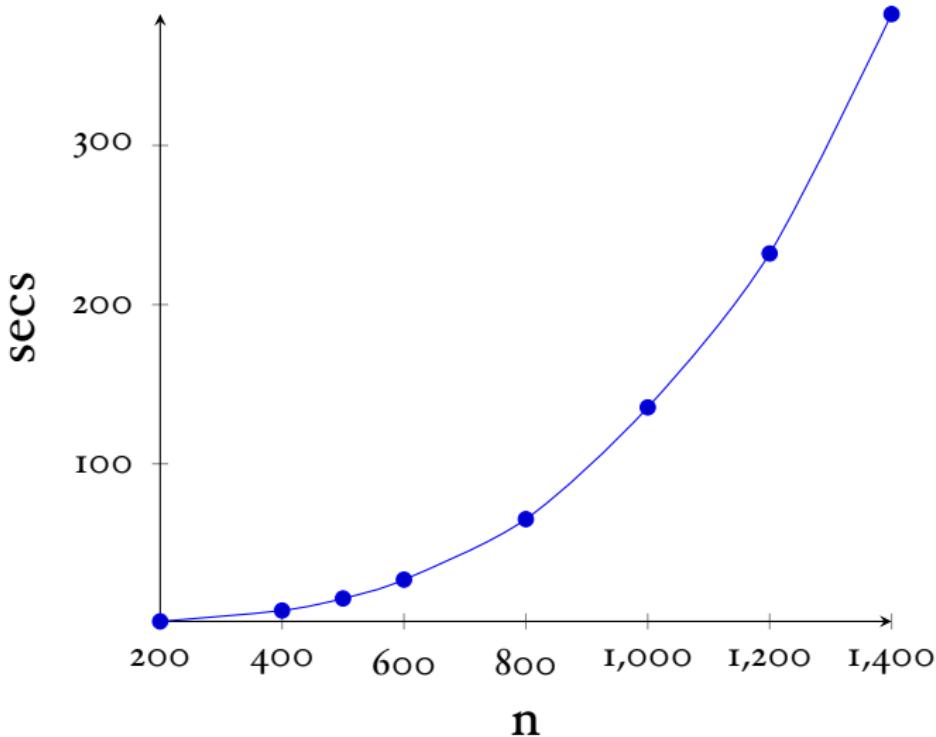

# Interpreter (2)

$$\begin{aligned}\text{eval}(\text{skip}, E) &\stackrel{\text{def}}{=} E \\ \text{eval}(x := a, E) &\stackrel{\text{def}}{=} E(x \mapsto \text{eval}(a, E)) \\ \text{eval}(\text{if } b \text{ then } cs_1 \text{ else } cs_2, E) &\stackrel{\text{def}}{=} \\ &\quad \text{if eval}(b, E) \text{ then eval}(cs_1, E) \\ &\quad \text{else eval}(cs_2, E) \\ \text{eval}(\text{while } b \text{ do } cs, E) &\stackrel{\text{def}}{=} \\ &\quad \text{if eval}(b, E) \\ &\quad \text{then eval}(\text{while } b \text{ do } cs, \text{eval}(cs, E)) \\ &\quad \text{else } E \\ \text{eval}(\text{write } x, E) &\stackrel{\text{def}}{=} \{ \text{println}(E(x)) ; E \}\end{aligned}$$

# Test Program

```
start := 1000;
x := start;
y := start;
z := start;
while 0 < x do {
    while 0 < y do {
        while 0 < z do { z := z - 1 };
        z := start;
        y := y - 1
    };
    y := start;
    x := x - 1
}
```

# Interpreted Code

# Java Virtual Machine

- introduced in 1995
- is a stack-based VM (like Postscript, CLR of .Net)
- contains a JIT compiler
- many languages take advantage of JVM's infrastructure (JRE)
- is garbage collected ⇒ no buffer overflows
- some languages compile to the JVM: Scala, Clojure...
