

Compilers and Formal Languages (8)

Email: christian.urban at kcl.ac.uk

Office: N7.07 (North Wing, Bush House)

Slides: KEATS (also home work is there)

Stmt ::= skip
| *Id* := **AExp**
| if **BExp** then **Block** else **Block**
| while **BExp** do **Block**
| read *Id*
| write *Id*
| write *String*

Stmts ::= **Stmt** ; **Stmts**
| **Stmt**

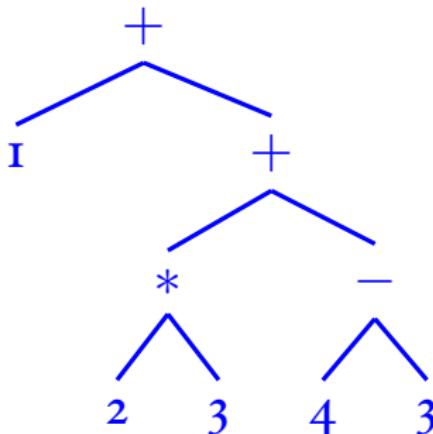

Block ::= { **Stmts** }
| **Stmt**

AExp ::= ...

BExp ::= ...

Compiling AExps

For example $i + ((2 * 3) + (4 - 3))$:

ldc 1
ldc 2
ldc 3
imul
ldc 4
ldc 3
isub
iadd
iadd

Traverse tree in post-order \Rightarrow code for stack-machine

Compiling AExps

$$\text{compile}(n, E) \stackrel{\text{def}}{=} \text{ldc } n$$

$$\begin{aligned} \text{compile}(a_1 + a_2, E) &\stackrel{\text{def}}{=} \\ &\text{compile}(a_1, E) @ \text{compile}(a_2, E) @ \text{iadd} \end{aligned}$$

$$\begin{aligned} \text{compile}(a_1 - a_2, E) &\stackrel{\text{def}}{=} \\ &\text{compile}(a_1, E) @ \text{compile}(a_2, E) @ \text{isub} \end{aligned}$$

$$\begin{aligned} \text{compile}(a_1 * a_2, E) &\stackrel{\text{def}}{=} \\ &\text{compile}(a_1, E) @ \text{compile}(a_2, E) @ \text{imul} \end{aligned}$$

$$\begin{aligned} \text{compile}(a_1 \setminus a_2, E) &\stackrel{\text{def}}{=} \\ &\text{compile}(a_1, E) @ \text{compile}(a_2, E) @ \text{idiv} \end{aligned}$$

$$\text{compile}(x, E) \stackrel{\text{def}}{=} \text{iload } E(x)$$

Compiling Ifs

For example

```
if 1 = 1 then x := 2 else y := 3
```

```
ldc 1
ldc 1
if_icmpne L_ifelse
ldc 2
istore 0
goto L_ifend
L_ifelse:
ldc 3
istore 1
L_ifend:
```

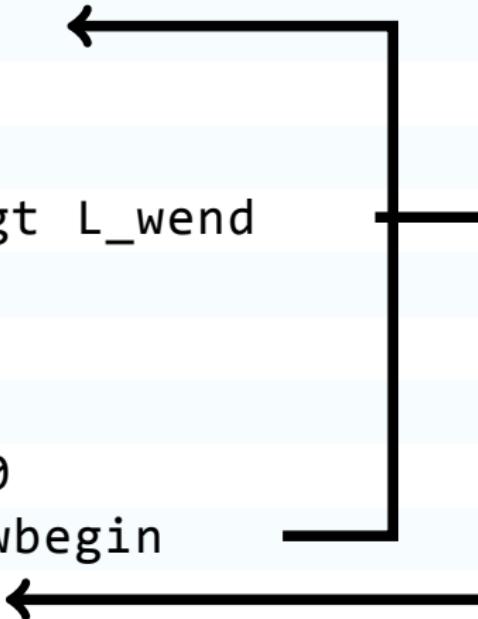

```
graph TD; A[ldc 1] --> B[if_icmpne L_ifelse]; A --> C[ldc 2]; B --> D[L_ifend: ldc 3  
istore 1]; B --> E[L_ifelse: ldc 2  
istore 0]; D --> B; E --> B;
```

Compiling Whiles

For example

```
while x <= 10 do x := x + 1
```

```
L_wbegin:  
    iload 0  
    ldc 10  
    if_icmpgt L_wend  
    iload 0  
    ldc 1  
    iadd  
    istore 0  
    goto L_wbegin  
L_wend:
```

Compiling Writes

```
.method public static write(I)V
    .limit locals 1
    .limit stack 2
    getstatic java/lang/System/out
        Ljava/io/PrintStream;
    iload 0
    invokevirtual java/io/PrintStream/println(I)V
    return
.end method
```

iload $E(x)$
invokestatic XXX/XXX/write(I)V

Compiling Main

```
.class public XXX.XXX
.super java/lang/Object

.method public <init>()V
    aload_0
    invokespecial java/lang/Object/<init>()V
    return
.end method

.method public static main([Ljava/lang/String;)V
    .limit locals 200
    .limit stack 200

    ...here comes the compiled code...

    return
.end method
```

Functional Programming

```
def fib(n) = if n == 0 then 0
             else if n == 1 then 1
             else fib(n - 1) + fib(n - 2);

def fact(n) = if n == 0 then 1 else n * fact(n - 1);

def ack(m, n) = if m == 0 then n + 1
                 else if n == 0 then ack(m - 1, 1)
                 else ack(m - 1, ack(m, n - 1));

def gcd(a, b) = if b == 0 then a else gcd(b, a % b);
```

Fun Grammar

Exp ::= *Var* | *Num*
| *Exp* + *Exp* | ... | (*Exp*)
| if *BExp* then *Exp* else *Exp*
| write *Exp*
| *Exp* ; *Exp* | *FunName* (*Exp*, ..., *Exp*)

BExp ::= ...

Def ::= def *FunName* (*x₁*, ..., *x_n*) = *Exp*

Prog ::= *Def* ; *Prog* | *Exp* ; *Prog* | *Exp*

Abstract Syntax Trees

```
abstract class Exp
abstract class BExp
abstract class Decl

case class Var(s: String) extends Exp
case class Num(i: Int) extends Exp
case class Aop(o: String, a1: Exp, a2: Exp) extends Exp
case class If(a: BExp, e1: Exp, e2: Exp) extends Exp
case class Write(e: Exp) extends Exp
case class Sequ(e1: Exp, e2: Exp) extends Exp
case class Call(name: String, args: List[Exp]) extends Exp

case class Bop(o: String, a1: Exp, a2: Exp) extends BExp

case class Def(name: String,
               args: List[String],
               body: Exp) extends Decl
case class Main(e: Exp) extends Decl
```

Idea

Compile `exp` such that the result of the expression is on top of the stack.

- `writeln + 2, 1 + 2; 3 + 4`

Sequences

Compiling exp1 ; exp2:

compile(exp1)

pop

compile(exp2)

Write

Compiling call to `write(1+2)`:

```
compile(1+2)
dup
invokestatic XXX/XXX/write(I)V
```

needs the helper method

```
.method public static write(I)V
    .limit locals 1
    .limit stack 2
    getstatic java/lang/System/out Ljava/io/PrintStream;
    iload 0
    invokevirtual java/io/PrintStream/println(I)V
    return
.end method
```

Function Definitions

```
.method public static write(I)V
    .limit locals 1
    .limit stack 2
    getstatic java/lang/System/out Ljava/io/PrintStream;
    iload 0
    invokevirtual java/io/PrintStream/println(I)V
    return
.end method
```

We will need for definitions, like

```
def fname (x1, ... , xn) = ...
```

```
.method public static fname (I...I)I
    .limit locals ??
    .limit stack ??
    ??
.end method
```

Stack Estimation

$\text{estimate}(n)$	$\stackrel{\text{def}}{=} \text{I}$
$\text{estimate}(x)$	$\stackrel{\text{def}}{=} \text{I}$
$\text{estimate}(a_1 \text{ aop } a_2)$	$\stackrel{\text{def}}{=} \text{estimate}(a_1) + \text{estimate}(a_2)$
$\text{estimate}(\text{if } b \text{ then } e_1 \text{ else } e_2)$	$\stackrel{\text{def}}{=} \text{estimate}(b) + \max(\text{estimate}(e_1), \text{estimate}(e_2))$
$\text{estimate}(\text{write}(e))$	$\stackrel{\text{def}}{=} \text{estimate}(e) + \text{I}$
$\text{estimate}(e_1; e_2)$	$\stackrel{\text{def}}{=} \max(\text{estimate}(e_1), \text{estimate}(e_2))$
$\text{estimate}(f(e_1, \dots, e_n))$	$\stackrel{\text{def}}{=} \sum_{i=1..n} \text{estimate}(e_i)$
$\text{estimate}(a_1 \text{ bop } a_2)$	$\stackrel{\text{def}}{=} \text{estimate}(a_1) + \text{estimate}(a_2)$

Successor Function

```
.method public static suc(I)I
.limit locals 1
.limit stack 2
    iload 0
    ldc 1
    iadd
    ireturn
.end method
```

```
def suc(x) = x + 1;
```

Addition Function

```
.method public static add(II)I
.limit locals 2
.limit stack 5
    iload 0
    ldc 0
    if_icmpne If_else
    iload 1
    goto If_end
If_else:
    iload 0
    ldc 1
    isub
    iload 1
    invokestatic XXX/XXX/add(II)I
    invokestatic XXX/XXX/suc(I)I
If_end:
    ireturn
.end method
```

```
def add(x, y) =
    if x == 0 then y
    else suc(add(x - 1, y));
```

Factorial

```
.method public static fact(II)I
.limit locals 2
.limit stack 6
    iload 0
    ldc 0
    if_icmpne If_else_2
    iload 1
    goto If_end_3
If_else_2:
    iload 0
    ldc 1
    isub
    iload 0
    iload 1
    imul
    invokestatic fact/fact/fact(II)I
If_end_3:
    ireturn
.end method
```

```
def fact(n, acc) =
    if n == 0 then acc
    else fact(n - 1, n * acc);
```

```
.method public static fact(II)I  
.limit locals 2  
.limit stack 6
```

```
fact_Start:
```

```
    iload 0  
    ldc 0  
    if_icmpne If_else_2  
    iload 1  
    goto If_end_3
```

```
If_else_2:
```

```
    iload 0  
    ldc 1  
    isub  
    iload 0  
    iload 1  
    imul
```

```
    istore 1
```

```
    istore 0
```

```
    goto fact_Start
```

```
If_end_3:
```

```
    ireturn
```

```
def fact(n, acc) =  
    if n == 0 then acc  
    else fact(n - 1, n * acc);
```

Tail Recursion

A call to `f(args)` is usually compiled as

```
args onto stack  
invokestatic .../f
```

Tail Recursion

A call to $f(args)$ is usually compiled as

```
args onto stack  
invokestatic .../f
```

A call is in tail position provided:

- if Bexp then Exp else Exp
- Exp ; Exp
- Exp op Exp

then a call $f(args)$ can be compiled as

```
prepare environment  
jump to start of function
```

Tail Recursive Call

```
def compile_expT(a: Exp, env: Mem, name: String): Instrs =  
  ...  
  case Call(n, args) => if (name == n)  
  {  
    val stores = args.zipWithIndex.map  
      { case (x, y) => "istore " + y.toString + "\n" }  
    args.flatMap(a => compile_expT(a, env, "")) ++  
    stores.reverse ++  
    List ("goto " + n + "_Start\n")  
  }  
  else  
  {  
    val is = "I" * args.length  
    args.flatMap(a => compile_expT(a, env, "")) ++  
    List ("invokestatic XXX/XXX/" + n + "(" + is + ")I\n")  
  }
```

Dijkstra on Testing

“Program testing can be a very effective way to show the presence of bugs, but it is hopelessly inadequate for showing their absence.”

What is good about compilers: they either seem to work, or go horribly wrong (most of the time).

Proving Programs to be Correct

Theorem: There are infinitely many prime numbers.

Proof ...

similarly

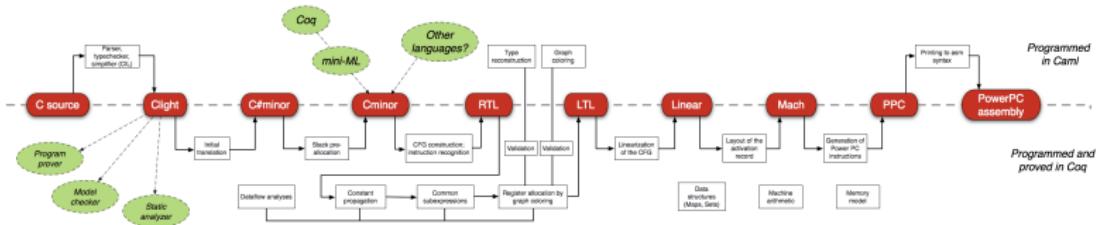

Theorem: The program is doing what it is supposed to be doing.

Long, long proof ...

This can be a gigantic proof. The only hope is to have help from the computer. ‘Program’ is here to be understood to be quite general (compiler, OS, ...).

Can This Be Done?

- in 2008, verification of a small C-compiler
 - “if my input program has a certain behaviour, then the compiled machine code has the same behaviour”
 - is as good as gcc -O1, but much, much less buggy

Fuzzy Testing C-Compilers

- tested GCC, LLVM and others by randomly generating C-programs
- found more than 300 bugs in GCC and also many in LLVM (some of them highest-level critical)
- about CompCert:

“The striking thing about our CompCert results is that the middle-end bugs we found in all other compilers are absent. As of early 2011, the under-development version of CompCert is the only compiler we have tested for which Csmith cannot find wrong-code errors. This is not for lack of trying: we have devoted about six CPU-years to the task.”
