

Homework 5

1. Consider the basic regular expressions

$$r ::= \emptyset \mid \epsilon \mid c \mid r_1 + r_2 \mid r_1 \cdot r_2 \mid r^*$$

and suppose you want to show a property $P(r)$ for all regular expressions r by structural induction. Write down which cases do you need to analyse. State clearly the induction hypotheses if applicable in a case.

2. Define a regular expression, written *ALL*, that can match every string. This definition should be in terms of the following extended regular expressions:

$$r ::= \emptyset \mid \epsilon \mid c \mid r_1 + r_2 \mid r_1 \cdot r_2 \mid r^* \mid \sim r$$

3. Define the following regular expressions

$$\begin{array}{ll} r^+ & \text{(one or more matches)} \\ r^? & \text{(zero or one match)} \\ r^{\{n\}} & \text{(exactly } n \text{ matches)} \\ r^{\{m,n\}} & \text{(at least } m \text{ and maximal } n \text{ matches, with the} \\ & \text{assumption } m \leq n \text{)} \end{array}$$

in terms of the usual basic regular expressions

$$r ::= \emptyset \mid \epsilon \mid c \mid r_1 + r_2 \mid r_1 \cdot r_2 \mid r^*$$

4. Give the regular expressions for lexing a language consisting of identifiers, left-parenthesis (, right-parenthesis), numbers that can be either positive or negative, and the operations +, - and *.

Decide whether the following strings can be lexed in this language?

- (a) "(a3+3)*b"
- (b) ")()++-33"
- (c) "(b42/3)*3"

In case they can, give the corresponding token sequences. (Hint: Observe the maximal munch rule and the priorities of your regular expressions that make the process of lexing unambiguous.)

5. (Optional) Recall the definitions for *Der* and *der* from the lectures. Prove by induction on r the property that

$$L(\text{der } c r) = \text{Der } c (L(r))$$

holds.
