#### Two Weeks Ago: CFGs

A context-free grammar (CFG) G consists of:

- a finite set of nonterminal symbols (upper case)
- a finite terminal symbols or tokens (lower case)
- a start symbol (which must be a nonterminal)
- a set of rules

$$A \rightarrow \text{rhs}_1|\text{rhs}_2|\dots$$

where rhs are sequences involving terminals and nonterminals (can also be empty).

#### Two Weeks Ago: CFGs

A context-free grammar (CFG) G consists of:

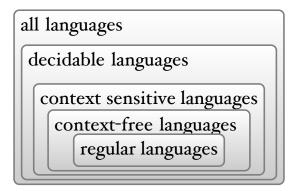

- a finite set of nonterminal symbols (upper case)
- a finite terminal symbols or tokens (lower case)
- a start symbol (which must be a nonterminal)
- a set of rules

$$A \rightarrow \text{rhs}_1|\text{rhs}_2|\dots$$

where rhs are sequences involving terminals and nonterminals (can also be empty).

#### **Hierarchy of Languages**

Recall that languages are sets of strings.

#### **Arithmetic Expressions**

A grammar for arithmetic expressions and numbers:

$$E \rightarrow E \cdot + \cdot E \mid E \cdot * \cdot E \mid (\cdot E \cdot) \mid N$$
  
 $N \rightarrow N \cdot N \mid 0 \mid 1 \mid \dots \mid 9$ 

Unfortunately left-recursive (and ambiguous).

A problem for recursive descent parsers (e.g. parser combinators).

#### **Arithmetic Expressions**

A grammar for arithmetic expressions and numbers:

$$E \rightarrow E \cdot + \cdot E \mid E \cdot * \cdot E \mid (\cdot E \cdot) \mid N$$
  
 $N \rightarrow N \cdot N \mid 0 \mid 1 \mid \dots \mid 9$ 

Unfortunately left-recursive (and ambiguous).

A problem for recursive descent parsers (e.g. parser combinators).

#### **Numbers**

$$N \rightarrow N \cdot N \mid 0 \mid 1 \mid \dots \mid 9$$

A non-left-recursive, non-ambiguous grammar for numbers

$$N \rightarrow 0 \cdot N \mid 1 \cdot N \mid \dots \mid 0 \mid 1 \mid \dots \mid 9$$

#### **Operator Precedences**

To disambiguate

$$E \rightarrow E \cdot + \cdot E \mid E \cdot * \cdot E \mid (\cdot E \cdot) \mid N$$

Decide how many precedence levels, say highest for (), medium for \*, lowest for +

$$egin{array}{lll} E_{low} & 
ightarrow & E_{med} \cdot + \cdot E_{low} \mid E_{med} \ E_{med} & 
ightarrow & E_{hi} \cdot * \cdot E_{med} \mid E_{hi} \ E_{hi} & 
ightarrow & (\cdot E_{low} \cdot) \mid N \end{array}$$

## **Operator Precedences**

To disambiguate

$$E \rightarrow E \cdot + \cdot E \mid E \cdot * \cdot E \mid (\cdot E \cdot) \mid N$$

Decide how many precedence levels, say highest for (), medium for \*, lowest for +

$$egin{array}{lll} E_{low} & 
ightarrow & E_{med} \cdot + \cdot E_{low} \mid E_{med} \ E_{med} & 
ightarrow & E_{hi} \cdot * \cdot E_{med} \mid E_{hi} \ E_{hi} & 
ightarrow & (\cdot E_{low} \cdot) \mid N \end{array}$$

What happens with 1 + 3 + 4?

## **Removing Left-Recursion**

The rule for numbers is directly left-recursive:

$$N \rightarrow N \cdot N \mid 0 \mid 1 \quad (...)$$

**Translate** 

## **Removing Left-Recursion**

The rule for numbers is directly left-recursive:

$$N \rightarrow N \cdot N \mid 0 \mid 1 \quad (\dots)$$

Translate

Which means

$$\begin{array}{ccc} \boldsymbol{N} & \rightarrow & 0 \cdot \boldsymbol{N'} \mid 1 \cdot \boldsymbol{N'} \\ \boldsymbol{N'} & \rightarrow & \boldsymbol{N} \cdot \boldsymbol{N'} \mid \epsilon \end{array}$$

#### **Chomsky Normal Form**

All rules must be of the form

$$A \rightarrow a$$

or

$$A \rightarrow B \cdot C$$

No rule can contain  $\epsilon$ .

#### $\epsilon$ -Removal

- ① If  $A \to \alpha \cdot B \cdot \beta$  and  $B \to \epsilon$  are in the grammar, then add  $A \to \alpha \cdot \beta$  (iterate if necessary).
- Throw out all  $B \to \epsilon$ .

$$\begin{array}{ll} \boldsymbol{N} \rightarrow \boldsymbol{0} \cdot \boldsymbol{N'} \mid \boldsymbol{1} \cdot \boldsymbol{N'} & \quad \boldsymbol{N} \rightarrow \boldsymbol{0} \cdot \boldsymbol{N'} \mid \boldsymbol{1} \cdot \boldsymbol{N'} \mid \boldsymbol{0} \mid \boldsymbol{1} \\ \boldsymbol{N'} \rightarrow \boldsymbol{N} \cdot \boldsymbol{N'} \mid \boldsymbol{\epsilon} & \quad \boldsymbol{N'} \rightarrow \boldsymbol{N} \cdot \boldsymbol{N'} \mid \boldsymbol{N} \mid \boldsymbol{\epsilon} \end{array}$$

## **CYK Algorithm**

```
egin{array}{lll} S & 
ightarrow & N \cdot P \ P & 
ightarrow & V \cdot N \ N & 
ightarrow & N \cdot N \ N & 
ightarrow & {
m students} \mid {
m Jeff} \mid {
m geometry} \mid {
m trains} \ V & 
ightarrow & {
m trains} \ \end{array}
```

Jeff trains geometry students

#### **CYK Algorithm**

- runtime is  $O(n^3)$
- grammars need to be transferred into CNF

#### **Parse Trees**

$$E \rightarrow F \mid F \cdot * \cdot F$$

$$F \rightarrow T \mid T \cdot + \cdot T \mid T \cdot - \cdot T$$

$$T \rightarrow num\_token \mid (\cdot E \cdot)$$

$$(2*3)+(3+4) \qquad E$$

$$F \mid T \qquad T$$

$$(E) \qquad (E)$$

$$F \cdot F \qquad F$$

$$T \qquad T + T$$

#### **Ambiguous Grammars**

A CFG is ambiguous if there is a string that has at least parse trees.

$$egin{array}{lll} E & 
ightarrow & num\_token \ E & 
ightarrow & E \cdot + \cdot E \ E & 
ightarrow & E \cdot - \cdot E \ E & 
ightarrow & E \cdot * \cdot E \ E & 
ightarrow & (\cdot E \cdot) \end{array}$$

$$1 + 2 * 3 + 4$$

## **Dangling Else**

#### Another ambiguous grammar:

$$egin{array}{ll} E & 
ightarrow & ext{if $E$ then $E$} \ & | & ext{if $E$ then $E$ else $E$} \ & | & ext{id} \end{array}$$

if a then if x then y else c

#### **A CFG Derivation**

- lacktriangle Begin with a string with only the start symbol S
- ② Replace any non-terminal X in the string by the right-hand side of some production  $X \to rhs$
- Nepeat 2 until there are no non-terminals

$$S \rightarrow \ldots \rightarrow \ldots \rightarrow \ldots$$
