

We already proved that

If *nullable*(*r*) then *POSIX* (*mkeps* *r*) *r*

holds. This is essentially the “base case” for the correctness proof of the algorithm. For the “induction case” we need the following main theorem, which we are currently after:

If       (\*)   *POSIX* *v* (*der c r*) and  $\vdash v : \textit{der c r}$   
then       *POSIX* (*inj r c v*) *r*

That means a *POSIX* value *v* is still *POSIX* after injection. I am not sure whether this theorem is actually true in this full generality. Maybe it requires some restrictions.

If we unfold the *POSIX* definition in the then-part, we arrive at

$\forall v'. \text{ if } \vdash v' : r \text{ and } |\textit{inj r c v}| = |v'| \text{ then } |\textit{inj r c v}| \succ_r v'$

which is what we need to prove assuming the if-part (\*) in the theorem above. Since this is a universally quantified formula, we just need to fix a *v'*. We can then prove the implication by assuming

(a)  $\vdash v' : r$  and (b)  $|\textit{inj r c v}| = |v'|$

and our goal is

(*goal*)  $|\textit{inj r c v}| \succ_r v'$

There are already two lemmas proved that can transform the assumptions (a) and (b) into

(a\*)  $\vdash \textit{proj r c v}' : \textit{der c r}$  and (b\*)  $c \# |v| = |v'|$

Another lemma shows that

$|v'| = c \# |\textit{proj r c v}|$

Using (b\*) we can therefore infer

(b\*\*)  $|v| = |\textit{proj r c v}|$

The main idea of the proof is now a simple instantiation of the assumption *POSIX v (der c r)*. If we unfold the *POSIX* definition, we get

$\forall v'. \text{ if } \vdash v' : \text{der } c \ r \text{ and } |v| = |v'| \text{ then } v \succ_{\text{der } c \ r} v'$

We can instantiate this  $v'$  with  $\text{proj } r \ c \ v'$  and can use (a\*) and (b\*\*) in order to infer

$$v \succ_{\text{der } c \ r} \text{proj } r \ c \ v'$$

The point of the side-lemma below is that we can “add” an  $\text{inj}$  to both sides to obtain

$$\text{inj } r \ c \ v \succ_r \text{inj } r \ c \ (\text{proj } r \ c \ v')$$

Finally there is already a lemma proved that shows that an injection and projection is the identity, meaning

$$\text{inj } r \ c \ (\text{proj } r \ c \ v') = v'$$

With this we have shown our goal (pending a proof of the side-lemma next).

### Side-Lemma

A side-lemma needed for the theorem above which might be true, but can also be false, is as follows:

If

- (1)  $v_1 \succ_{\text{der } c \ r} v_2$ ,
- (2)  $\vdash v_1 : \text{der } c \ r$ , and
- (3)  $\vdash v_2 : \text{der } c \ r$  holds,

then  $\text{inj } r \ c \ v_1 \succ_r \text{inj } r \ c \ v_2$  also holds.

It essentially states that if one value  $v_1$  is bigger than  $v_2$  then this ordering is preserved under injections. This is proved by induction (on the definition of  $\text{der} \dots$  this is very similar to an induction on  $r$ ).

The case that is still unproved is the sequence case where we assume  $r = r_1 \cdot r_2$  and also  $r_1$  being nullable. The derivative  $\text{der } c \ r$  is then

$$\text{der } c \ r = ((\text{der } c \ r_1) \cdot r_2) + (\text{der } c \ r_2)$$

or without the parentheses

$$\text{der } c \ r = (\text{der } c \ r_1) \cdot r_2 + \text{der } c \ r_2$$

In this case the assumptions are

- (a)  $v_1 \succ_{(der\ c\ r_1) \cdot r_2 + der\ c\ r_2} v_2$
- (b)  $\vdash v_1 : (der\ c\ r_1) \cdot r_2 + der\ c\ r_2$
- (c)  $\vdash v_2 : (der\ c\ r_1) \cdot r_2 + der\ c\ r_2$
- (d)  $nullable(r_1)$

The induction hypotheses are

- (IH1)  $\forall v_1 v_2. v_1 \succ_{der\ c\ r_1} v_2 \wedge \vdash v_1 : der\ c\ r_1 \wedge \vdash v_2 : der\ c\ r_1$   
 $\longrightarrow inj\ r_1\ c\ v_1 \succ_{r_1} inj\ r_1\ c\ v_2$
- (IH2)  $\forall v_1 v_2. v_1 \succ_{der\ c\ r_2} v_2 \wedge \vdash v_1 : der\ c\ r_2 \wedge \vdash v_2 : der\ c\ r_2$   
 $\longrightarrow inj\ r_2\ c\ v_1 \succ_{r_2} inj\ r_2\ c\ v_2$

The goal is

$$(goal) \quad inj\ (r_1 \cdot r_2)\ c\ v_1 \succ_{r_1 \cdot r_2} inj\ (r_1 \cdot r_2)\ c\ v_2$$

If we analyse how (a) could have arisen (that is make a case distinction), then we will find four cases:

- LL  $v_1 = Left(w_1), v_2 = Left(w_2)$
- LR  $v_1 = Left(w_1), v_2 = Right(w_2)$
- RL  $v_1 = Right(w_1), v_2 = Left(w_2)$
- RR  $v_1 = Right(w_1), v_2 = Right(w_2)$

We have to establish our goal in all four cases.

### Case LR

The corresponding rule (instantiated) is:

$$\frac{len\ |w_1| \geq len\ |w_2|}{Left(w_1) \succ_{(der\ c\ r_1) \cdot r_2 + der\ c\ r_2} Right(w_2)}$$

This means we can also assume in this case

$$(e) \quad len\ |w_1| \geq len\ |w_2|$$

which is the premise of the rule above. Instantiating  $v_1$  and  $v_2$  in the assumptions (b) and (c) gives us

- (b\*)  $\vdash Left(w_1) : (der\ c\ r_1) \cdot r_2 + der\ c\ r_2$
- (c\*)  $\vdash Right(w_2) : (der\ c\ r_1) \cdot r_2 + der\ c\ r_2$

Since these are assumptions, we can further analyse how they could have arisen according to the rules of  $\vdash \_ : \_$ . This gives us two new assumptions

$$\begin{aligned} (\mathbf{b}^{**}) \quad & \vdash w_1 : (\mathit{der} \ c \ r_1) \cdot r_2 \\ (\mathbf{c}^{**}) \quad & \vdash w_2 : \mathit{der} \ c \ r_2 \end{aligned}$$

Looking at  $(\mathbf{b}^{**})$  we can further analyse how this judgement could have arisen. This tells us that  $w_1$  must have been a sequence, say  $u_1 \cdot u_2$ , with

$$\begin{aligned} (\mathbf{b}^{***}) \quad & \vdash u_1 : \mathit{der} \ c \ r_1 \\ & \vdash u_2 : r_2 \end{aligned}$$

Instantiating the goal means we need to prove

$$\mathit{inj} \ (r_1 \cdot r_2) \ c \ (\mathit{Left}(u_1 \cdot u_2)) \succ_{r_1 \cdot r_2} \mathit{inj} \ (r_1 \cdot r_2) \ c \ (\mathit{Right}(w_2))$$

We can simplify this according to the rules of  $\mathit{inj}$ :

$$(\mathit{inj} \ r_1 \ c \ u_1) \cdot u_2 \succ_{r_1 \cdot r_2} (\mathit{mkeps} \ r_1) \cdot (\mathit{inj} \ r_2 \ c \ w_2)$$

This is what we need to prove. There are only two rules that can be used to prove this judgement:

$$\frac{v_1 = v'_1 \quad v_2 \succ_{r_2} v'_2}{v_1 \cdot v_2 \succ_{r_1 \cdot r_2} v'_1 \cdot v'_2} \quad \frac{v_1 \succ_{r_1} v'_1}{v_1 \cdot v_2 \succ_{r_1 \cdot r_2} v'_1 \cdot v'_2}$$

Using the left rule would mean we need to show that

$$\mathit{inj} \ r_1 \ c \ u_1 = \mathit{mkeps} \ r_1$$

but this can never be the case.<sup>1</sup> Lets assume it would be true, then also if we flat each side, it must hold that

$$|\mathit{inj} \ r_1 \ c \ u_1| = |\mathit{mkeps} \ r_1|$$

But this leads to a contradiction, because the right-hand side will be equal to the empty list, or empty string. This is because we assumed  $\mathit{nullable}(r_1)$  and there is a lemma called `mkeps_flat` which shows this. On the other side we know by assumption  $(\mathbf{b}^{***})$  and lemma `v4` that the other side needs to be a string starting with  $c$  (since we inject  $c$  into  $u_1$ ). The empty string can never be equal to something starting with  $c$ ... therefore there is a contradiction.

<sup>1</sup>Actually Isabelle found this out after analysing its argument. ;o)

That means we can only use the rule on the right-hand side to prove our goal. This implies we need to prove

$$\text{inj } r_1 \text{ c } u_1 \succ_{r_1} \text{mkeps } r_1$$

### Case RL

The corresponding rule (instantiated) is:

$$\frac{\text{len } |w_1| > \text{len } |w_2|}{\text{Right}(w_1) \succ_{(\text{der } c \text{ } r_1) \cdot r_2 + \text{der } c \text{ } r_2} \text{Left}(w_2)}$$

### Problems in the paper proof

I cannot verify
