## Why Scala?

...

lichess engine (open source) lichess.org

•••

#### A former student working now at Quantexa:

"I am a former student. I graduated last year. I got my dream job as a backend Scala developer. Most of the Scala I know is from PEP 2018/19. My interviewers said they expect code of a lesser quality even from people with one year of experience."

"I am currently working as a software engineer at Morgan Stanley whilst doing my year-in-industry and am using Scala in the workplace. My team were impressed that I could already program in the language and even had knowledge of other functional languages. They told me that most university students are not taught such languages."

– Sumaiya Mohbubul 2021/22

"PEP was my favourite module so far during these 2 years. It motivated me to apply and get a summer internship offer at S&P Global as a Scala developer. The module content was more than enough for me to start working on the projects here at the company."

– Szabolcs Nagy 2021/22

## Why Scala?

• compiles to the JVM

(also JavaScript, native X86 in the works)

- integrates seamlessly with Java
- combines <u>functional</u> and **object-oriented** programming
- no pointers, no null
- often one can write very concise and elegant code

## Java vs Scala

```
public class Point {
  private final int x, y;
                                              2
                                              3
  public Point(int x, int y) {
    this.x = x;
                                              5
    this.y = y;
                                              7
                                              8
  public int x() { return x; }
                                              9
                                              10
  public int y() { return y; }
                                              11
                                              12
```

Java

case class Point(x: Int, y: Int)

## First Steps: Scala 3 Tools

- contains a REPL  $\Rightarrow$  but this year we use scala-cli
- I use VS Codium and a Scala extension (M'place)

PEP (Scala) 01, King's College London – p. 14/28

### Seq vs Par

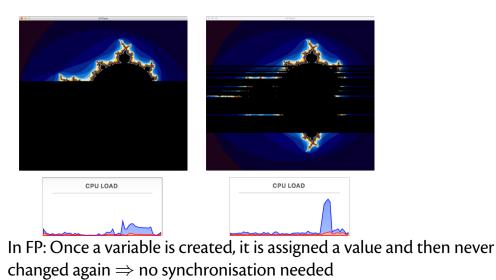

## Seq vs Par

PEP (Scala) 01, King's College London – p. 14/28

## Types

- Base types
  - Int, Long, BigInt, Float, Double String, Char Boolean
- Compound types
  - List[Int]
    Set[Double]
    (Int, String)
    List[(BigInt, String)]
    List[List[Int]]
    Option[Int]

lists of Int's sets of Double's Int-String pair lists of BigInt-String pairs list of lists of Int's options of Int's

### def fname(arg1: ty1, arg2: ty2,..., argn: tyn): rty = {

. . . .

}

```
def average(xs: List[Int]) : Int = {
  val s = xs.sum
  val n = xs.length
  s / n
}
```

## The Joy of Immutability

• If you need to manipulate some data in a list say, then you make a new list with the updated values, rather than revise the original list. Easy!

- You do not have to be defensive about who can access the data.
- You can look at your code in isolation.

### Email: Hate 'val'

Subject: Hate 'val'

01:00 AM

Hello Mr Urban,

I just wanted to ask, how are we suppose to work with the completely useless **val**, that can't be changed ever? Why is this rule active at all? I've spent 4 hours not thinking on the coursework, but how to bypass this annoying rule. What's the whole point of all these coursework, when we can't use everything Scala gives us?!?

Regards.

«my usual rant about fp...
concurrency bla bla... better programs yada»
PS: What are you trying to do where you desperately
want to use var?
```

#### Subject: Re: Re: Hate 'val'

#### 01:04 AM

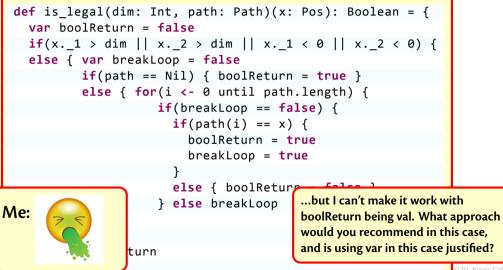

### Right now my is\_legal function works fine:

```
def is legal(dim: Int, path: Path)(x: Pos): Boolean = {
  var boolReturn = false
  if(x._1 > dim || x._2 > dim || x._1 < 0 || x._2 < 0) 
  else { var breakLoop = false
          if(path == Nil) { boolReturn = true }
          else { for(i <- 0 until path.length) {</pre>
                     if(breakLoop == false) {
                       if(path(i) == x) {
                         boolReturn = true
                         breakLoop = true
                       else { boolReturp
                                         ...but I can't make it work with
                     } else breakLoop
                                          boolReturn being val. What approach
                                          would you recommend in this case,
                                          and is using var in this case justified?
          boolReturn
```

#### Subject: Re: Re: Hate 'val'

#### 01:04 AM

## Right now my is\_legal function works fine:

# Subject: Re: Re: Hate 'val'

# 01:06 AM

OK. So you want to make sure that the x-position is not outside the board....and furthermore you want to make sure that the x-position is not yet in the path list. How about something like

def is\_legal(dim: Int, path: Path)(x: Pos): Boolean =
 ...<<some board conditions>>... && !path.contains(x)

Does not even contain a val.

(This is all on one line)

"PEP was my favourite module so far during these 2 years. It motivated me to apply and get a summer internship offer at S&P Global as a Scala developer. The module content was more than enough for me to start working on the projects here at the company." — Szabolcs Daniel Nagi (PEP 2021)

# **Conclusion for Today**

- This year we will be using Scala 3 with the scala-cli REPL!
- https://scala-cli.virtuslab.org/
- Scala can be a rather **deep** language...i.e. gives you a lot of rope to shoot yourself.
- Learning functional programming is not easy...when you have spent all of your career thinking in an imperative way, it is hard to change.
- Hope you have fun with Scala and the assignments.
