Murphy's computer

Satan's computers

## **Defence in Depth**

urbanc:\$6\$3WWbKfr1\$4vblknvGr6FcDeF92R5xFn3mskfdnEn...:...

- hashes help when password databases are leaked
- salts help with protecting against dictionary attacks and help people who have the same password on different sites
- but they do not protect against a focused attack against a single password and also do not make poorly chosen passwords any better

### **Subtle Points**

- in our web-application the salt needed to remain secret; in password files the salt is public
- the NYT has the "resource" unlocked at first and locks it depending on the cookie data
- our "web-application" has the resource locked at first, and unlocks it depending on the cookie data

#### **How to Salt?**

- $\texttt{1salt} \ \Rightarrow \ \texttt{8189effef4d4f7411f4153b13ff72546dd682c69}$
- $2salt \Rightarrow 1528375d5ceb7d71597053e6877cc570067a738f$
- 3salt  $\Rightarrow$  d646e213d4f87e3971d9dd6d9f435840eb6a1c06
- 4salt  $\Rightarrow$  5b9e85269e4461de0238a6bf463ed3f25778cbba
- in Unix systems: hash(salt + password), or even hash<sup>1500</sup>(salt + password)

#### **How to Salt?**

- $\texttt{1salt} \ \Rightarrow \ \texttt{8189effef4d4f7411f4153b13ff72546dd682c69}$
- $2salt \Rightarrow 1528375d5ceb7d71597053e6877cc570067a738f$
- 3salt  $\Rightarrow$  d646e213d4f87e3971d9dd6d9f435840eb6a1c06
- 4salt  $\Rightarrow$  5b9e85269e4461de0238a6bf463ed3f25778cbba
- in Unix systems: hash(salt + password), or even hash<sup>1500</sup>(salt + password)
- Bruce Schneier in cases messages are long: instead of m → hash(m), use m → hash(hash(m) + m)

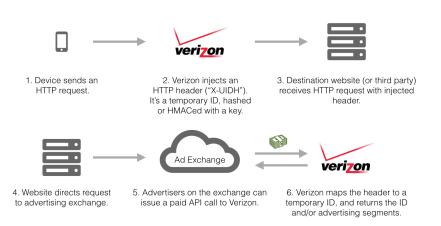

#### **User-Tracking Without Cookies**

Can you track a user **without**:

- Cookies
- JavaScript
- LocalStorage/SessionStorage/GlobalStorage
- Flash, Java or other plugins
- Your IP address or user agent string
- Any methods employed by Panopticlick
   → https://panopticlick.eff.org/

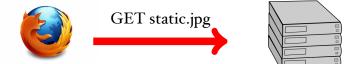

Even when you disabled cookies entirely, have JavaScript turned off and use a VPN service, and also ...

### **Today's Lecture**

#### online banking vs e-voting solved unsolved

SEN 02, King's College London - p. 9/39

"Any electronic voting system should provide at least the same security, privacy and transparency as the system it replaces."

What are the security requirements of a voting system?

What are the security requirements of a voting system?

Integrity

- The outcome matches with the voters' intend.
- There might be gigantic sums at stake and need to be defended against.

What are the security requirements of a voting system?

- Integrity
- Ballot Secrecy

What are the security requirements of a voting system?

- Integrity
- Ballot Secrecy

- Nobody can find out how you voted.
- (Stronger) Even if you try, you cannot prove how you voted.

What are the security requirements of a voting system?

- Integrity
- Ballot Secrecy
- Voter Authentication

• Only authorised voters can vote up to the permitted number of votes.

What are the security requirements of a voting system?

- Integrity
- Ballot Secrecy
- Voter Authentication
- Enfranchisement

• Authorised voters should have the opportunity to vote.

What are the security requirements of a voting system?

- Integrity
- Ballot Secrecy
- Voter Authentication
- Enfranchisement
- Availability

The voting system should accept all authorised votes and produce results in a timely manner.

## **Problems with Voting**

Integrity vs. Ballot Secrecy

Authentication vs. Enfranchisement

SEN 02, King's College London - p. 12/39

## **Problems with Voting**

#### Integrity vs. Ballot Secrecy

#### Authentication vs. Enfranchisement

Further constraints:

- o costs
- accessibility
- onvenience
- intelligibility

#### **Traditional Ballot Boxes**

#### **Traditional Ballot Boxes**

#### mechanical, but they need a "protocol"

SEN 02, King's College London - p. 13/39

## **Motives for E-Voting**

- 76% of pensioners in the UK vote, but only 44% of the under-25s
- convenience
- speed

# **E-Voting**

- The Netherlands between 1997 2006 had electronic voting machines (hacktivists had found: they can be hacked and also emitted radio signals revealing how you voted)
- Germany had used them in pilot studies (in 2007 a law suit has reached the highest court and it rejected electronic voting on the grounds of not being understandable by the general public)
- UK used optical scan voting systems in a few test polls, but abandoned any wide deployment

- US used mechanical machines since the 30s, later punch cards, now DREs and optical scan voting machines
- Estonia used in 2007 the Internet for national elections (there were earlier pilot studies in other countries)
- India uses e-voting devices since at least 2003 ("keep-it-simple" machines produced by a government owned company)
- South Africa used software for its tallying in the 1993 elections (when Nelson Mandela was elected) (they found the tallying software was rigged, but they were able to tally manually)

# **E-Voting in Estonia**

- worlds first general election that used internet voting (2007)
- builds on the Estonian ID card (a smartcard like CC)
- Internet voting can be used before the election (votes can be changed an unlimited amount of times, last vote is tabulated, you can even change your vote on the polling day in person)
- in the 2011 parliamentary election 24% voted via Internet

# **E-Voting in Estonia**

- worlds first general election that used internet voting (2007)
- builds on the Estonian ID card (a smartcard like CC)
- Internet voting can be used before the election (votes can be changed an unlimited amount of times, last vote is tabulated, you can even change your vote on the polling day in person)
- in the 2011 parliamentary election 24% voted via Internet
- needs to trust the integrity of voters' computers, central server components and the election staff

#### E-Voting in **Theory**

- Alice prepares and audits a ballot, then casts an encrypted ballot, which requires her to authenticate to a server.
- A bulletin board posts Alice's name and encrypted ballot. Anyone, including Alice, can check the bulletin board and find her encrypted vote posted.
- When the election closes, all votes are shuffled and the system produces a non-interactive proof of a correct shuffling. (zero-knowledge-proofs)
- After a reasonable complaint period to let auditors check the shuffling, all shuffled ballots are decrypted, and the system provides a decryption proof for each decrypted ballot. (zero-knowledge-proofs)
- Perform a tally of the decrypted votes.
- An auditor can download the entire election data and verify the shuffle, decryptions and tally.

# **A Brief History of Voting**

#### • Athenians

- show of hands
- ballots on pieces of pottery
- different colours of stones
- "facebook"-like authorisation

problems with vote buying / no ballot privacy

• French Revolution and the US Constitution got things "started" with paper ballots (you first had to bring your own; later they were pre-printed by parties)

### **Ballot Boxes**

Security policies with paper ballots:

- you need to check that the ballot box is empty at the start of the poll / no false bottom (to prevent ballot stuffing)
- you need to guard the ballot box during the poll until counting
- tallied by a team at the end of the poll (independent observers)

Which security requirements do paper ballots satisfy better than voice voting?

- Integrity
- Enfranchisement
- Ballot secrecy
- Voter authentication
- Availability

What can go wrong with paper ballots?

#### What can go wrong with paper ballots?

William M. Tweed, US Politician in 1860's "As long as I count the votes, what are you going to do about it?"

SEN 02, King's College London - p. 23/39

## **Paper Ballots**

What can go wrong with paper ballots?

### **Chain Voting Attack**

- you obtain a blank ballot and fill it out as you want
- you give it to a voter outside the polling station
- voter receives a new blank ballot
- voter submits prefilled ballot
- voter gives blank ballot to you, you give money

### **Mechanical Voting Machines**

#### • Lever Voting Machines (ca. 1930 - 1990)

### **Mechanical Voting Machines**

- Lever Voting Machines (ca. 1930 1990)
- Punch Cards (ca. 1950 2000)

## **Electronic Voting Machines**

#### DREs

#### **Optical Scan**

SEN 02, King's College London - p. 25/39

## **Electronic Voting Machines**

#### DREs

#### **Optical Scan**

all are "computers"

SEN 02, King's College London - p. 25/39

Direct-recording electronic voting machines (votes are recorded for example on memory cards) typically touchscreen machines usually no papertrail

Alex Halderman:

- acquired a machine from an anonymous source
- they try to keep secret the source code running the machine

Alex Halderman:

- acquired a machine from an anonymous source
- they try to keep secret the source code running the machine
- first reversed-engineered the machine (extremely tedious)
- could completely reboot the machine and even install a virus that infects other Diebold machines
- obtained also the source code for other machines

What could go wrong?

#### What could go wrong? Failure-in-depth.

What could go wrong? Failure-in-depth.

A non-obvious problem:

- you can nowadays get old machines, which still store old polls
- the paper ballot box needed to be secured during the voting until counting; e-voting machines need to be secured during the entire life-time

#### Conclusion: Any electronic solution should have a paper trail.

#### Conclusion: Any electronic solution should have a paper trail.

You still have to solve problems about voter registration, voter authentication, guarding against tampering

SEN 02, King's College London - p. 29/39

## **E-Voting in India**

Their underlying engineering principle is "keep-it-simple":

## **E-Voting in India**

Their underlying engineering principle is "keep-it-simple":

Official claims: "perfect", "tamperproof", "no need for technical improvements", "infallible"

### **Lessons Learned**

- keep a paper trail and design your system to keep this secure
- make the software open source (avoid security-by-obscurity)
- have a simple design in order to minimise the attack surface

### **Lessons Learned**

- keep a paper trail and design your system to keep this secure
- make the software open source (avoid security-by-obscurity)
- have a simple design in order to minimise the attack surface

But overall, in times of NSA/state sponsored cyber-crime, e-voting is too hard with current technology.

### **Online Banking vs. E-Voting**

- online banking: if fraud occurs you try to identify who did what (somebody's account got zero)
- e-voting: some parts can be done electronically, but not the actual voting

## **Student In-Lecture Polling**

- can guarantee anonymity
- integrity by electronic means
- how to achieve the same in "software"?

• anonymity through one-time pads
