

# Access Control and Privacy Policies (10)

Email: christian.urban at kcl.ac.uk  
Office: S1.27 (1st floor Strand Building)  
Slides: KEATS (also homework is there)

# Revision

# 1st Lecture

- hashes and salts to guaranty data integrity
- storing passwords (brute force attacks and dictionary attacks)

# 2nd Lecture: E-Voting

- Integrity
- Ballot Secrecy
- Voter Authentication
- Enfranchisement
- Availability

# 2nd Lecture:

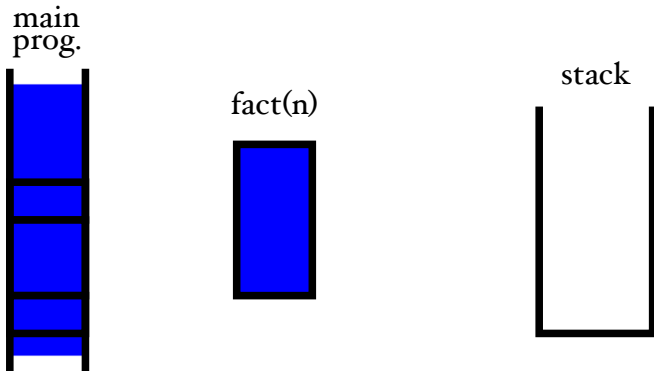

# E-Voting

## Online Banking vs. E-Voting

- online banking: if fraud occurred you try to identify who did what (somebody's account got zero)
- e-voting: some parts can be done electronically, but not the actual voting (final year project: online voting)

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Buffer Overflow Attacks

- the problem arises from the way C/C++ organises its function calls

# 3rd Lecture: Unix Access Control

- privileges are specified by file access permissions (“everything is a file”)

- the idea is make the attack surface smaller and mitigate the consequences of an attack

# 3rd Lecture:

## Unix Access Control

- when a file with setuid is executed, the resulting process will assume the UID given to the owner of the file

```
$ ls -ld . * */*
drwxr-xr-x 1 ping staff 32768 Apr  2 2010 .
-rw----r-- 1 ping students 31359 Jul 24 2011 manual.txt
-r--rw--w- 1 bob students 4359 Jul 24 2011 report.txt
-rwsr--r-x 1 bob students 141359 Jun  1 2013 microedit
dr--r-xr-x 1 bob staff 32768 Jul 23 2011 src

-r--rw---- 1 emma students 959 Jan 23 2012 src/code.h
```

# 4th Lecture:

## Security Levels

Bell-LaPadula access model:

- **Read Rule:** A principal  $P$  can read an object  $O$  if and only if  $P$ 's security level is at least as high as  $O$ 's.
- **Write Rule:** A principal  $P$  can write an object  $O$  if and only if  $O$ 's security level is at least as high as  $P$ 's.
- **Meta-Rule:** All principals in a system should have a sufficiently high security level in order to access an object.

# 4th Lecture: Security Levels

Biba (data integrity)

- Biba: **'no read down' - 'no write up'**
- **Read Rule:** A principal  $P$  can read an object  $O$  if and only if  $P$ 's security level is lower or equal than  $O$ 's.
- **Write Rule:** A principal  $P$  can write an object  $O$  if and only if  $O$ 's security level is lower or equal than  $P$ 's.

# 4th Lecture: Protocols

A mutual authentication protocol

$$\begin{aligned} A \rightarrow B: & N_a \\ B \rightarrow A: & \{N_a, N_b\}_{K_{ab}} \\ A \rightarrow B: & N_b \end{aligned}$$

# 5th Lecture: Access Control Logic

- formulas
- judgements

# 5th Lecture: Access Control Logic

- formulas
- judgements

Access Policy ( $\Gamma$ )

# 5th Lecture: Access Control Logic

entails sign

Gamma  
stands for a collection of formulas  
("assumptions")

# 5th Lecture: Inference Rules

premisses

$$\frac{\Gamma \vdash F_1 \quad \Gamma \vdash F_2}{\Gamma \vdash F_1 \wedge F_2}$$

conclusion

# 8th Lecture: Privacy

- differential privacy for anonymizing research data
- Tor webservice

# 9th Lecture: Privacy

- zero-knowledge proofs
- requires NP problems, for example graph isomorphisms
